

Module 4 - Exercise

Python in Firefox EXE

Modify our previous Python PoC script to match these criteria:-

1. Once we got a "pass" in the memory, print out the memory dump and stop debugging to minimize performance issues.
2. Export your script into exe using Py2exe.
3. Test it against Anti-Virus.
4. Test it while logging into your Twitter, Gmail, Paypal and Facebook accounts.

Hints:

- ✓ Add a new if statement saying if we found 'pass' while dumping memory, then we stop the debugging and print out the memory content.
- ✓ In Py2exe setup file replace 'window' with ' Console'.

The end result should look like the demonstration in this video.
